

WeeFree™ Women

Fill and flow diary

[illegible]

Record all your liquid intakes (fill) and urine outputs (flow) over a 24 hour period.

People with normal bladder function and a fluid intake of 6 to 8 cups a day, usually need to empty their bladders 4 to 6 times a day and pass 1 to 2 cups of urine each time. They can wait until it is convenient to go to the toilet. The urine flows easily until the bladder is empty and there is no leakage between visits to the toilet.
